(Vol. 31, No. 2)

February 1955

COWS ON TEST IN DAIRY-HERD-IMPROVEMENT ASSOCIATIONS

More cows were on test in dairy-herd-improvement associations January 1, 1955, than at any previous time. On that date, there were 2,288 associations in operation, with 41,240 herds enrolled and 1,333,866 cows on test.

Compared with January 1, 1954, this represents an increase of 113, or 5.2 percent, in number of associations, and an increase of 22,168 or 1.7 percent, in number of cows on test.

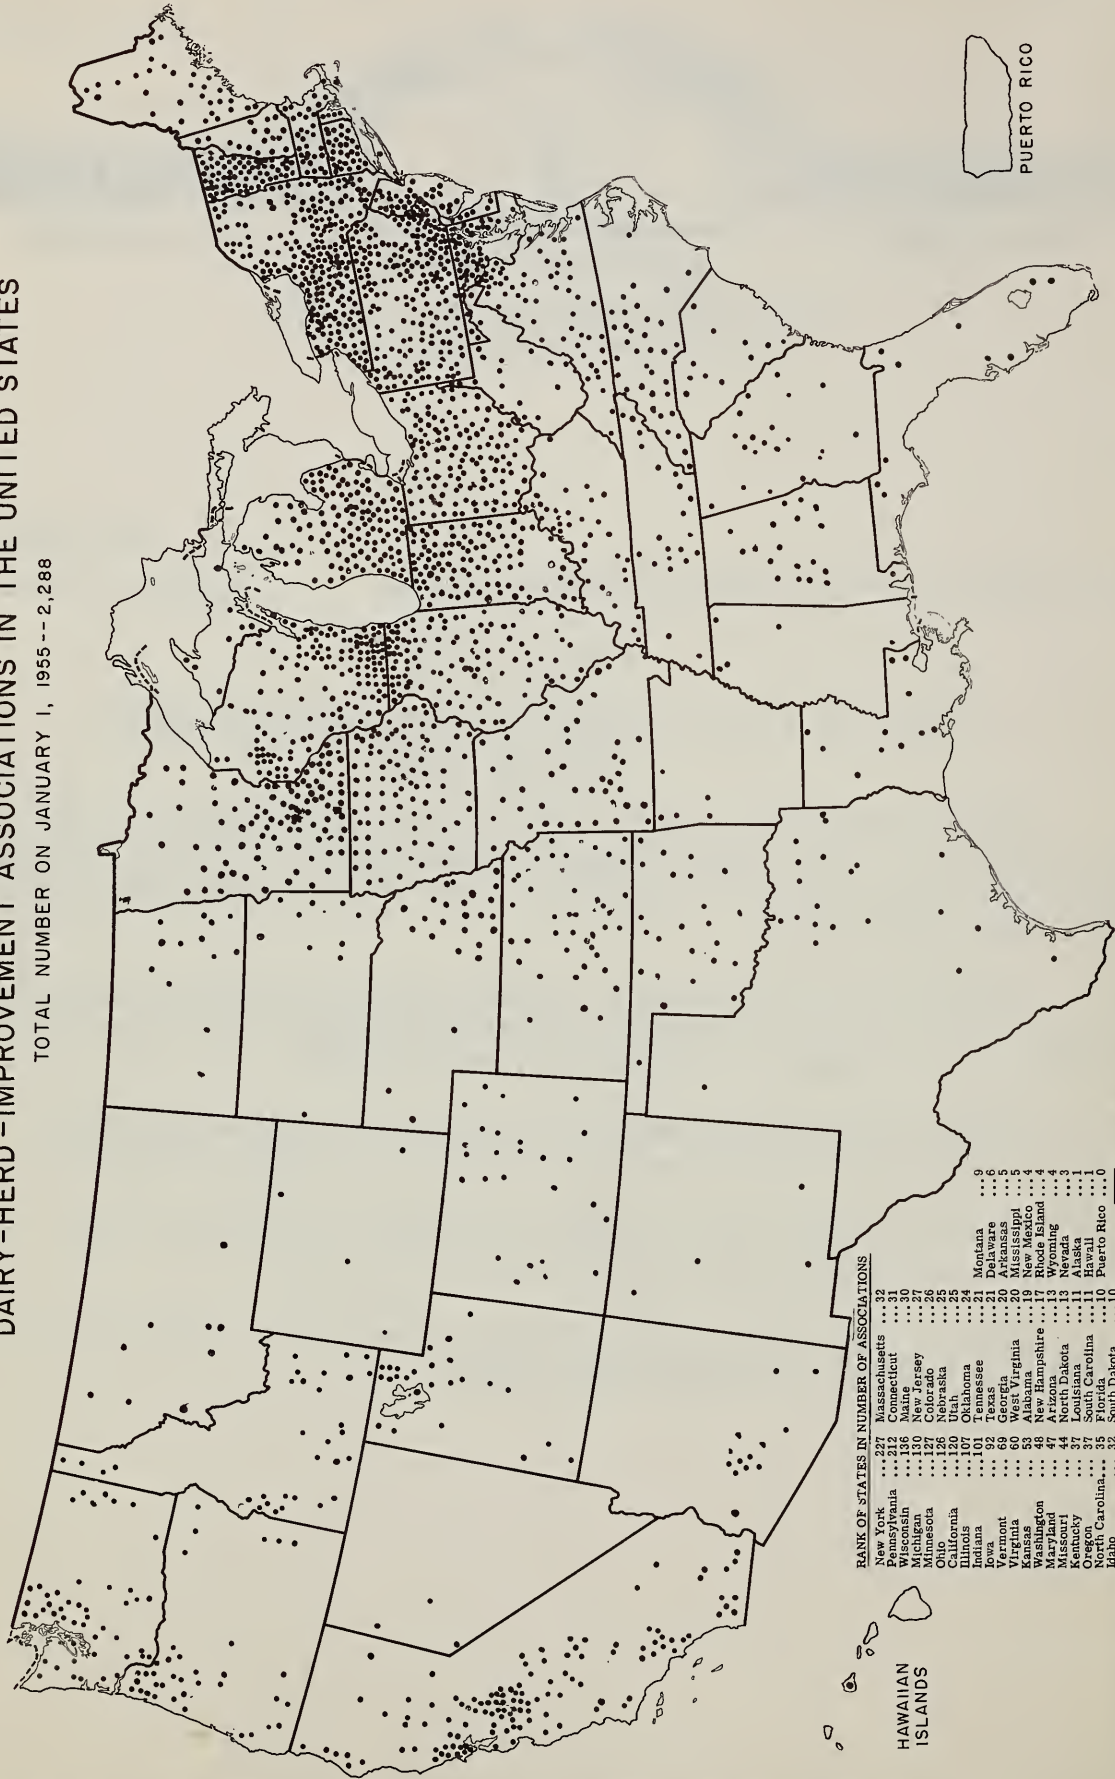

California leads the States in number of cows being tested, with 190,635, or 21.0 percent of the cows in the State on test.

Pennsylvania leads all States in number of herds on test, with 4,807 herds enrolled in the standard plan of testing.

Data on the status of dairy-herd-improvement association work by States are given on the following pages.

DAIRY-HERD-IMPROVEMENT ASSOCIATIONS IN THE UNITED STATES

DHIA PROVED-SIRE RECORDS TABULATED IN JANUARY 1955

Following is a list of 524 sires whose records were tabulated or retabulated by the Dairy Husbandry Research Branch in January 1955. Production records used in proving DHIA sires consist of 305-day lactation records standardized to a mature equivalent twice-a-day milking basis.

An asterisk at the end of a sire's registration number indicates a retabulated record. The asterisk may be followed by any number from 1 through 15 (i. e., *12) to indicate in which of the 15 printed lists his previous record appeared. Or the asterisk may be followed by the month and year (i. e., *May 51) of the DHIA letter in which his previous record appeared. Two asterisks following the sire's registration number, or following reference to a previous listing, indicate that the proved-sire tabulation or retabulation was requested by one of the States.

In case records from more than one herd were used, the reference is to the herd from which production records for the largest number of the sire's youngest daughters were reported. If the sire has been used in an artificial-breeding association, the name of the association is given.

Proved-sire records consisting of fewer than 10 comparisons are indicated as "preliminary" because these records may be significantly changed when additional comparisons become available and are included in the proved-sire records.

To make the most intelligent selection of a sire, the dairyman should use these proved-sire records to single out the most promising sire and then make every effort to supplement these data with additional information gathered from the herds in which the dams and daughters made their records. Particular attention should be given to the feeding practices and environmental conditions under which the records were made, in order to be assured that the records of the daughters were not made under more favorable conditions than those of the dams or vice versa. It is especially important to determine that there has been no selection of daughters in making the comparison.
